

Basic Indicators

preface

For two decades, since 1995, *Health Situation in the Americas: Basic Indicators* has been continuously providing the latest information on health indicators in the Region of the Americas. In keeping with its commitment to provide up-to-date information characterizing the situation and health trends in the Member States, the Pan American Health Organization (PAHO) continues to compile data from national information systems and United Nations agencies, covering demographics, morbidity and mortality, resources, access and coverage of health services and socioeconomic conditions. The data presented in this pamphlet have been collected, processed, and reviewed by the PAHO Health Information and Analysis technical team in collaboration with the ministries of health and planning and statistical offices of the Americas.

This year, the highlighted issue is avoidable premature mortality or simply “avoidable mortality”, that quantifies premature deaths – those occurring before age 75- that should not occur when timely and effective health care is available and when policies and programs are implemented for disease prevention.

In 2010, the most recent year for which mortality data are available in the largest number of countries, there were nearly 2.2 million deaths in the Americas, with 63% occurring among men (1.4 million). Significant differences between sexes were observed when the types of avoidable causes were considered: 70% of the deaths among men corresponded to causes considered to be avoidable through preventative measures, and 30% through implementation of timely and effective health care. Among women, the proportions were 53% and 47%, respectively.

The map on the title page presents the distribution of age-adjusted average rates for the period 2010-2012 in the Region. Figures have also been included that reflect the changes in mortality between 2001 and 2010, according to sex.

Given the many challenges involved in achieving universal health coverage and monitoring global and regional agreements, we hope that these measurements of premature mortality will help to guide decision – making aimed at reducing the number of avoidable deaths in the countries of the Americas. For more information, including basic indicators and their definitions, please visit <http://www.paho.org/ha>.

premature mortality from avoidable causes

Figure 1. Age adjusted premature mortality rate from avoidable causes in the Americas by sex, 2001 and 2010

"Avoidable mortality" is an indicator of premature death from health problems that could be averted by preventing the onset of the disease or delaying death by timely access to quality health services¹. Two years (2001 and 2010) were selected from the period 2001–2012 for this analysis, since a large number of countries had available mortality data for both these years. Deaths up to 74 years were considered and certain changes were observed over time. Countries were excluded if they lacked data for several years or had an estimated underreporting of more than 25% in 2011. Crude rates of avoidable mortality were calculated and adjusted for age using the direct method based on the WHO world standard population. In addition, the percentage change in the indicator between 2001 and 2010 was calculated by country and by sex. To prepare the map, the countries were classified using the Jenks natural breaks method, which identifies clusters with similar data and establishes cut points for different classes. To reduce variability due to small numbers, the map presents the average rates for the period 2010 – 2012 by country. Figure 1, on the other hand, shows the distribution of avoidable mortality in men and women in 2001 and 2010, by country.

In 2001, the regional average rate, for both sexes combined, was 272 avoidable deaths per 100,000 population with significant variability between countries (ranging from 83.4 to 748.7; median² 245.5). For 2010, a 10.5% reduction was observed in the regional average rate, bringing it to 230.9 avoidable deaths per 100,000 population, with wide variability between countries (range 44.2 - 513.2; median 219.7).

The analysis showed differences by sex, in the risk of dying from these avoidable causes. In 2001, the regional average rate for men was 343 avoidable deaths per 100,000 population (range 134.7 – 748.7; median 313.5) and for women, 192.5 per 100,000 population (range 83.4 – 445.7; median 184.6). The risk of dying prematurely from these causes was 78% higher among men than in women. In 2010, the regional average rates declined for both men and women: 14.5% among men, for a rate of 294 avoidable deaths per 100,000 population (range 111.3 - 513.2; median: 282.2), and 16.2% in women, for a rate of 168.2 (range 44.2 - 485.2; median: 158.3). At the regional level, the risk of dying declined in both sexes. However, the gap between men and women persisted throughout this period.

From a regional perspective, reductions were observed over time in premature deaths due to avoidable causes, with great variability between countries. It is important for countries to continue working towards a better understanding of avoidable mortality, in order to implement health care and public health measures such as timely access to quality of health services, improved eating habits, increased physical activity, elimination of tobacco use, and reduction of harmful alcohol use, among others. Inequalities such as those observed between the sexes should be taken into consideration to help improve coverage and achieve universal access to health, especially primary care. The regional increase of 3.5 years in life expectancy in the period of observation between 2001 and 2010 is not sufficient as it has not been accompanied by a concomitant improvement in quality of life. The principal problems associated with avoidable causes of death and the factors that contribute to reductions or increases should be studied and analyzed in more detail in order to help health services implement strategies to improve the health conditions of the inhabitants of the Region of the Americas.

¹ The set of "avoidable mortality" causes was built based on the experience of different researchers and some countries in the last 35 years. For additional references and the list of causes considered for this analysis the reader may visit: <https://hiss.paho.org/pahosys/ame.php>

² The median is the central value of the set of mortality rates ordered from minimum to maximum.

technical notes & sources

Technical Notes:

- Maternal mortality ratio, infant mortality rate and under-5-mortality (BI 10, 12, 13) are country reported data. An increase may reflect an improvement in data coverage and quality. The estimates of maternal mortality ratio (BI 11) are calculated by the Mortality Estimation Inter-Agency Group (MMEIG).
- Maternal mortality ratio (BI 10) as reported by the country (ECU, HTI, NIC, PAN, PRY) presents one or more of the following limitations: coverage of maternal deaths and live births, differences in the maternal death definition, different denominators used or the analysis of only confirmed maternal deaths.
- Infant mortality rate (BI 12) as reported by the country (ECU, ELS, GTM, GUY, PAN, PRY, TRT) presents limitations due to the coverage of deaths of infants < 1 or the number of live births.
- Certified deaths due to ill-defined and unknown conditions (BI 16) refer to death certificates issued in a given year for which the underlying cause of death was symptoms, signs, and other ill-defined and unknown conditions (ICD-10: R00-R99).
- Mortality under-registration (BI 17) is determined by subtracting from 1 the total deaths registered in a country-period divided by the corresponding total estimated deaths, obtained after applying the UN estimated crude death rates to the corresponding population estimates by the UN.
- Corrected mortality rates (BI 18–BI 28) are computed based on registered mortality data, applying a correction algorithm for mortality under-registration and a redistribution algorithm for deaths from ill-defined causes. The methodology used is presented in Health Statistics from the Americas, 2006 edition (<http://www.paho.org/HSA2006>). Observed rates are presented for two groups of countries. For countries with high quality data (proportion of under-registration and ill-defined causes of death under 10%) and for countries without inputs for correction. Age-adjusted mortality rates are computed by direct standardization to the WHO World Standard Population (<http://www.who.int/healthinfo/paper31.pdf>).
- Malaria risk areas population (BI 30) presents the proportion of the total population in a country living in high and moderate malaria transmission risk areas. Moderate risk: API between 1 to 10/1,000 pop; high risk: API > 10/1,000 pop.
- Dengue reported cases (BI 33) presents the number of cases of suspected and laboratory confirmed cases from dengue in a specific year, for a given country, territory, or geographic area.
- National Health Expenditure (BI 41) corresponds to the WHO National Health Accounts estimates. For more information: WHO Health expenditure database, <http://apps.who.int/nha/database/DocumentationCentre/Index/en>
- Public health expenditure (BI 41A): The sum of health outlays paid for in cash or supplied in kind by government entities, such as the Ministry of Health, other ministries, parastatal organizations or social security agencies (without double counting government transfers to social security and extra budgetary funds). It includes all expenditure made by these entities, regardless of the source, therefore, any donor funding passing through them. It includes transfer payments to households to offset medical care costs and extrabudgetary funds to finance health services and goods. It includes current and capital expenditure.
- Private health expenditure (BI 41B): The sum of outlays for health by private entities, such as households, commercial or mutual health insurance, non-profit institutions serving households, resident corporations and quasi-corporations with a health services delivery or financing function. It includes expenditures from all sources, therefore, any donor funding passing through these "financing agents".

The regional and subregional aggregates for rates, ratios and proportions are weighted averages, and sums for absolute numbers.

Information presented in this publication supersedes that of previous editions and is under ongoing review. Users are advised not to compare data series between different editions. Data sources were defined to ensure comparability; therefore, statistics in this publication presented here can differ from national statistics.

We continue to collect core indicators from Bonaire, San Eustatius and Saba (BES). In this edition, BES is not included due to insufficient data.

For this presentation: Latin America includes Mexico, the Central American Isthmus, the Latin Caribbean, the Andean Area, Brazil, and the Southern Cone. Latin America and the Caribbean comprise Latin America and Non-Latin Caribbean. Brazil and Mexico are being shown separately due to their population size.
