Cost-effectiveness in Pediatric Cancer

Soad Fuentes-Alabi, MD,MPH

PAHO/WHO Child Cancer Consultant

February 15, 2022

International Day of the Fight Against Childhood Cancer

Objective of presentation

- ❖ Introduction to the terminology and concepts of Cost-Effectiveness analysis.
- ❖ How to Interpret a Cost-Effectiveness Analysis.
- ❖ Present Case Study on Cost-Effectiveness of Treating Childhood Cancer in Developing Countries.

Contenido:

1. Introduction.

2. What is Cost-Effectiveness?

3. Why do a Cost-Effectiveness analysis.

4. Elements that are analyzed when evaluating the Cost-Effectiveness of a program or intervention?

5. What makes something profitable?

6. Case Study: "Cost-Effectiveness of Childhood Cancer Treatment in El Salvador, Central America: A Report from the Childhood Cancer Task Force 2030."

1. Introduction:

United Nations 2030

Agenda for Sustainable Development Goals:

Development Goals:

Include a package of child cancer services in guaranteed health care as an important step towards achieving universal health coverage

Identificar

Barreras: Wrong Perception that a better childhood cancer survival is equivalent to pediatric oncology services too expensive.

Evidence of Cost-Effective Intervention of Childhood Cancer:

Avoiding 6.2 million deaths in children with cancer between the period 2020-2050. This equates to producing a return of \$3 for every \$1 invested.

Reducing Gaps

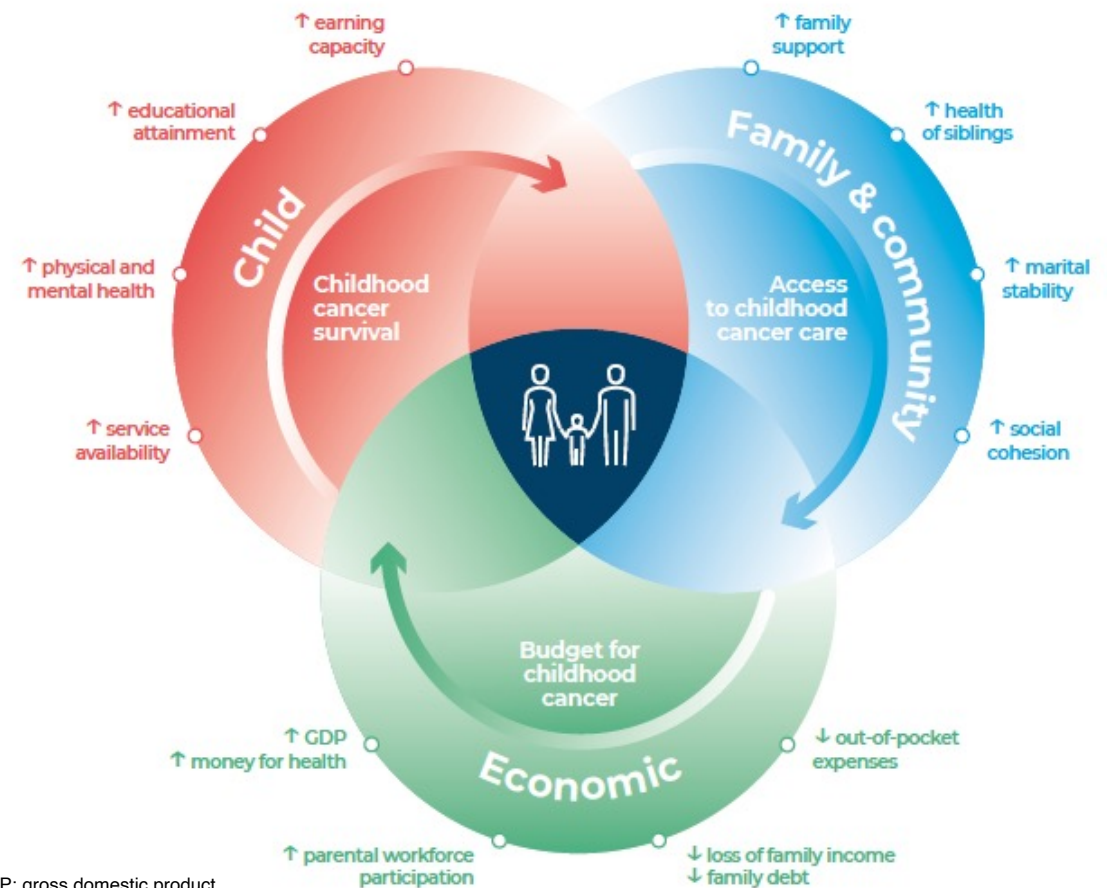

Table 5. Three-part strategy for the progressive realization of universal health coverage

Categorize services into priority classes, according to cost-effectiveness, priority for the most disadvantaged, and protection against financial risks.

Expand coverage of high-priority services for all. Eliminate out-of-pocket payments while increasing mandatory progressive payments with pooling funds.

Ensure that disadvantaged people are not left behind (including low-income groups and rural populations).

Figure 14. Economic and social value of investing in the cancer and other NCD prevention and control interventions

GDP: gross domestic product
Source: Adapted from WHO 2018 (45).

2. What is Cost-Effectiveness Analysis?

$$\text{DALY} = \text{YLL} + \text{YLD}$$

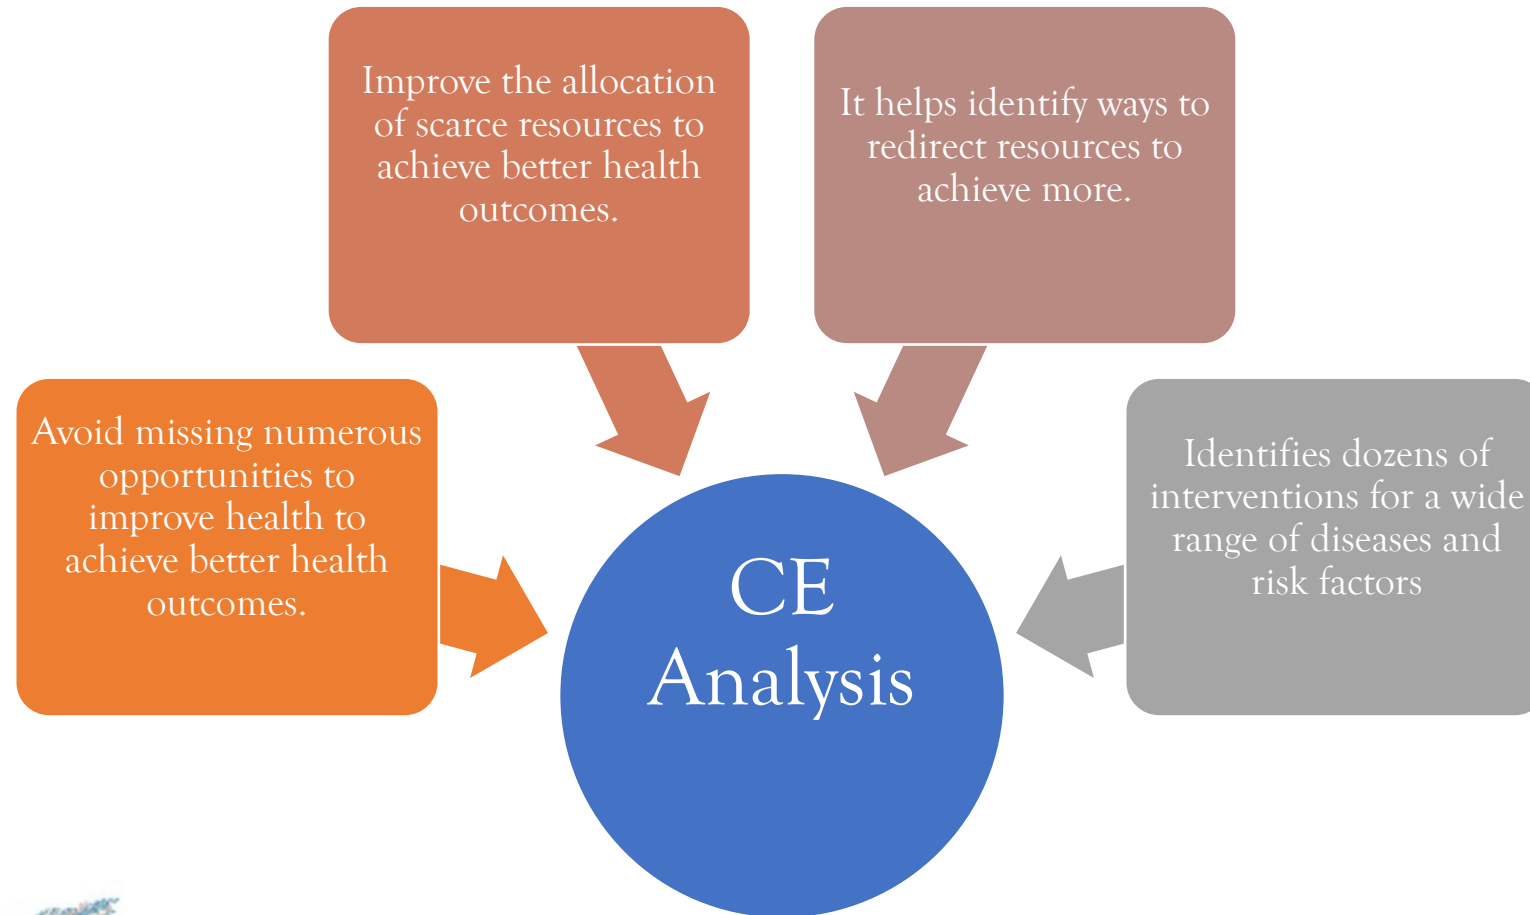

Health Intervention:

Cost-effectiveness ratio:

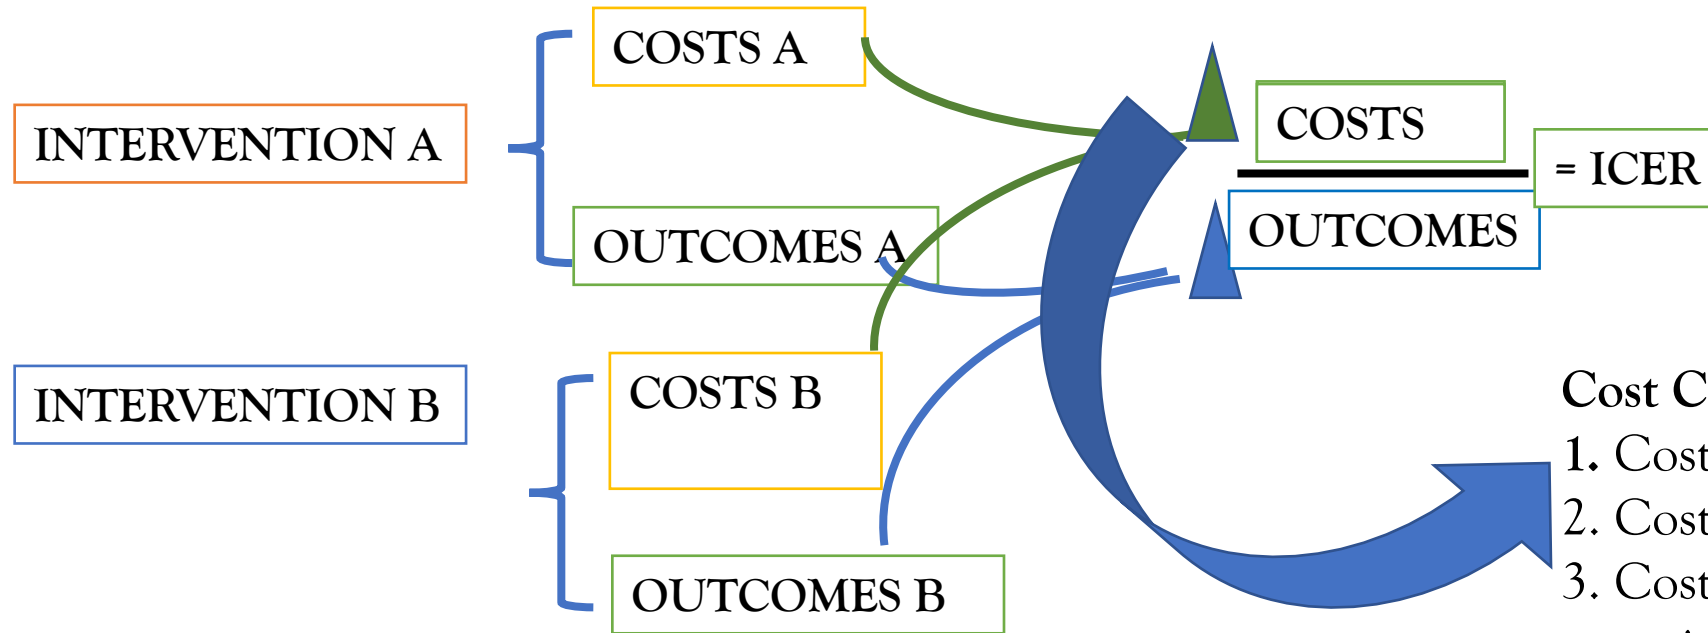

Average cost-effectiveness:

Incremental cost-effectiveness:

3. Why run a Cost-Effectiveness analysis

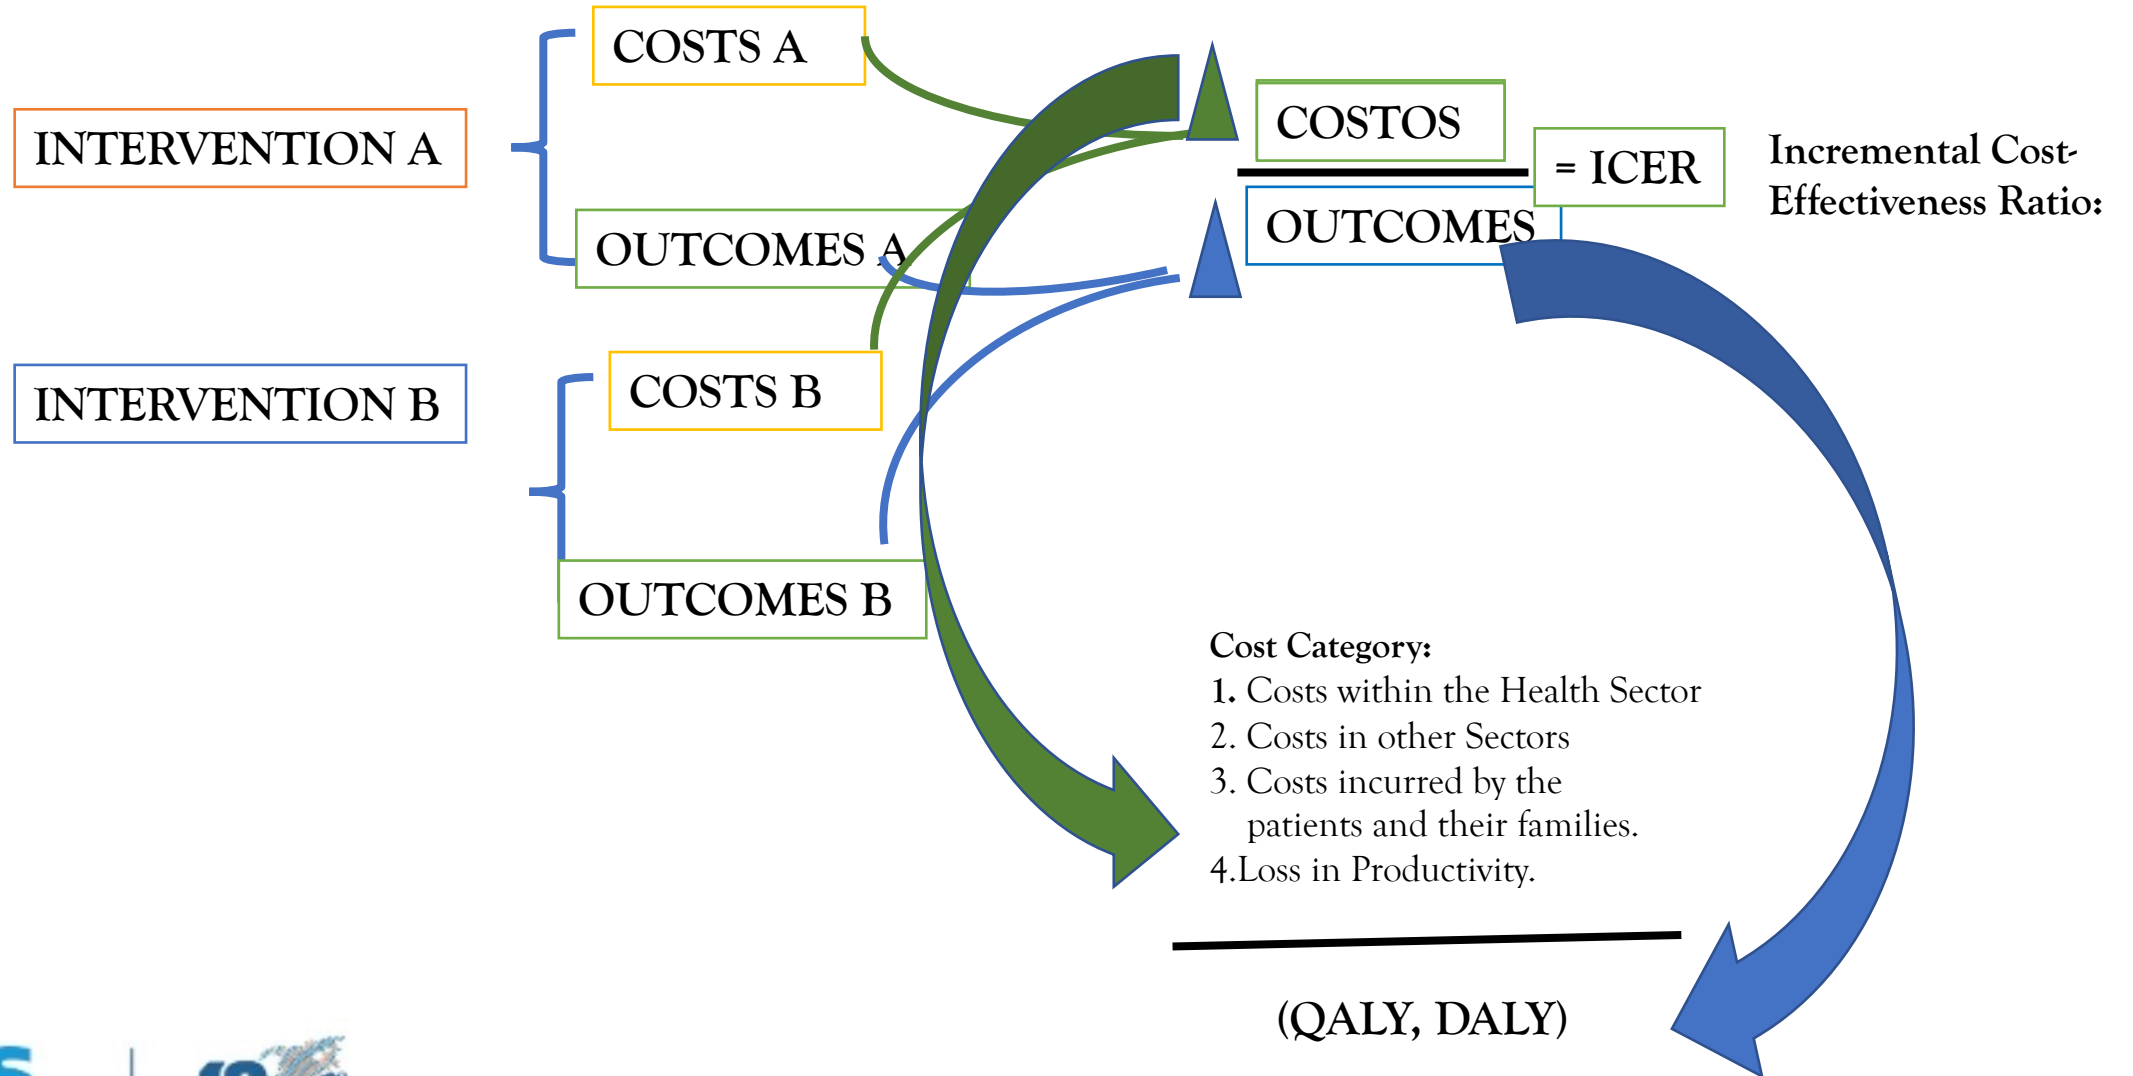

4. Elements that are analyzed when evaluating the Cost-Effectiveness of a program or intervention?

Cost Category:

1. Costs within the Health Sector
2. Costs in other Sectors
3. Costs incurred by the patients and their families.
4. Loss in Productivity.

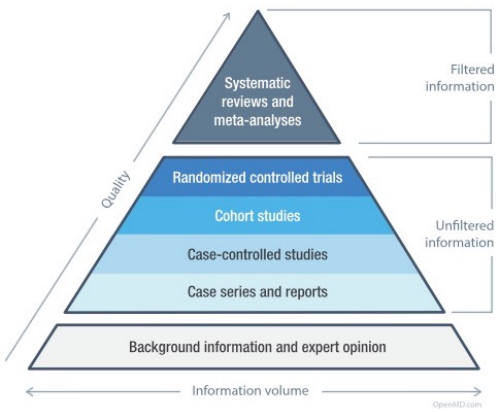

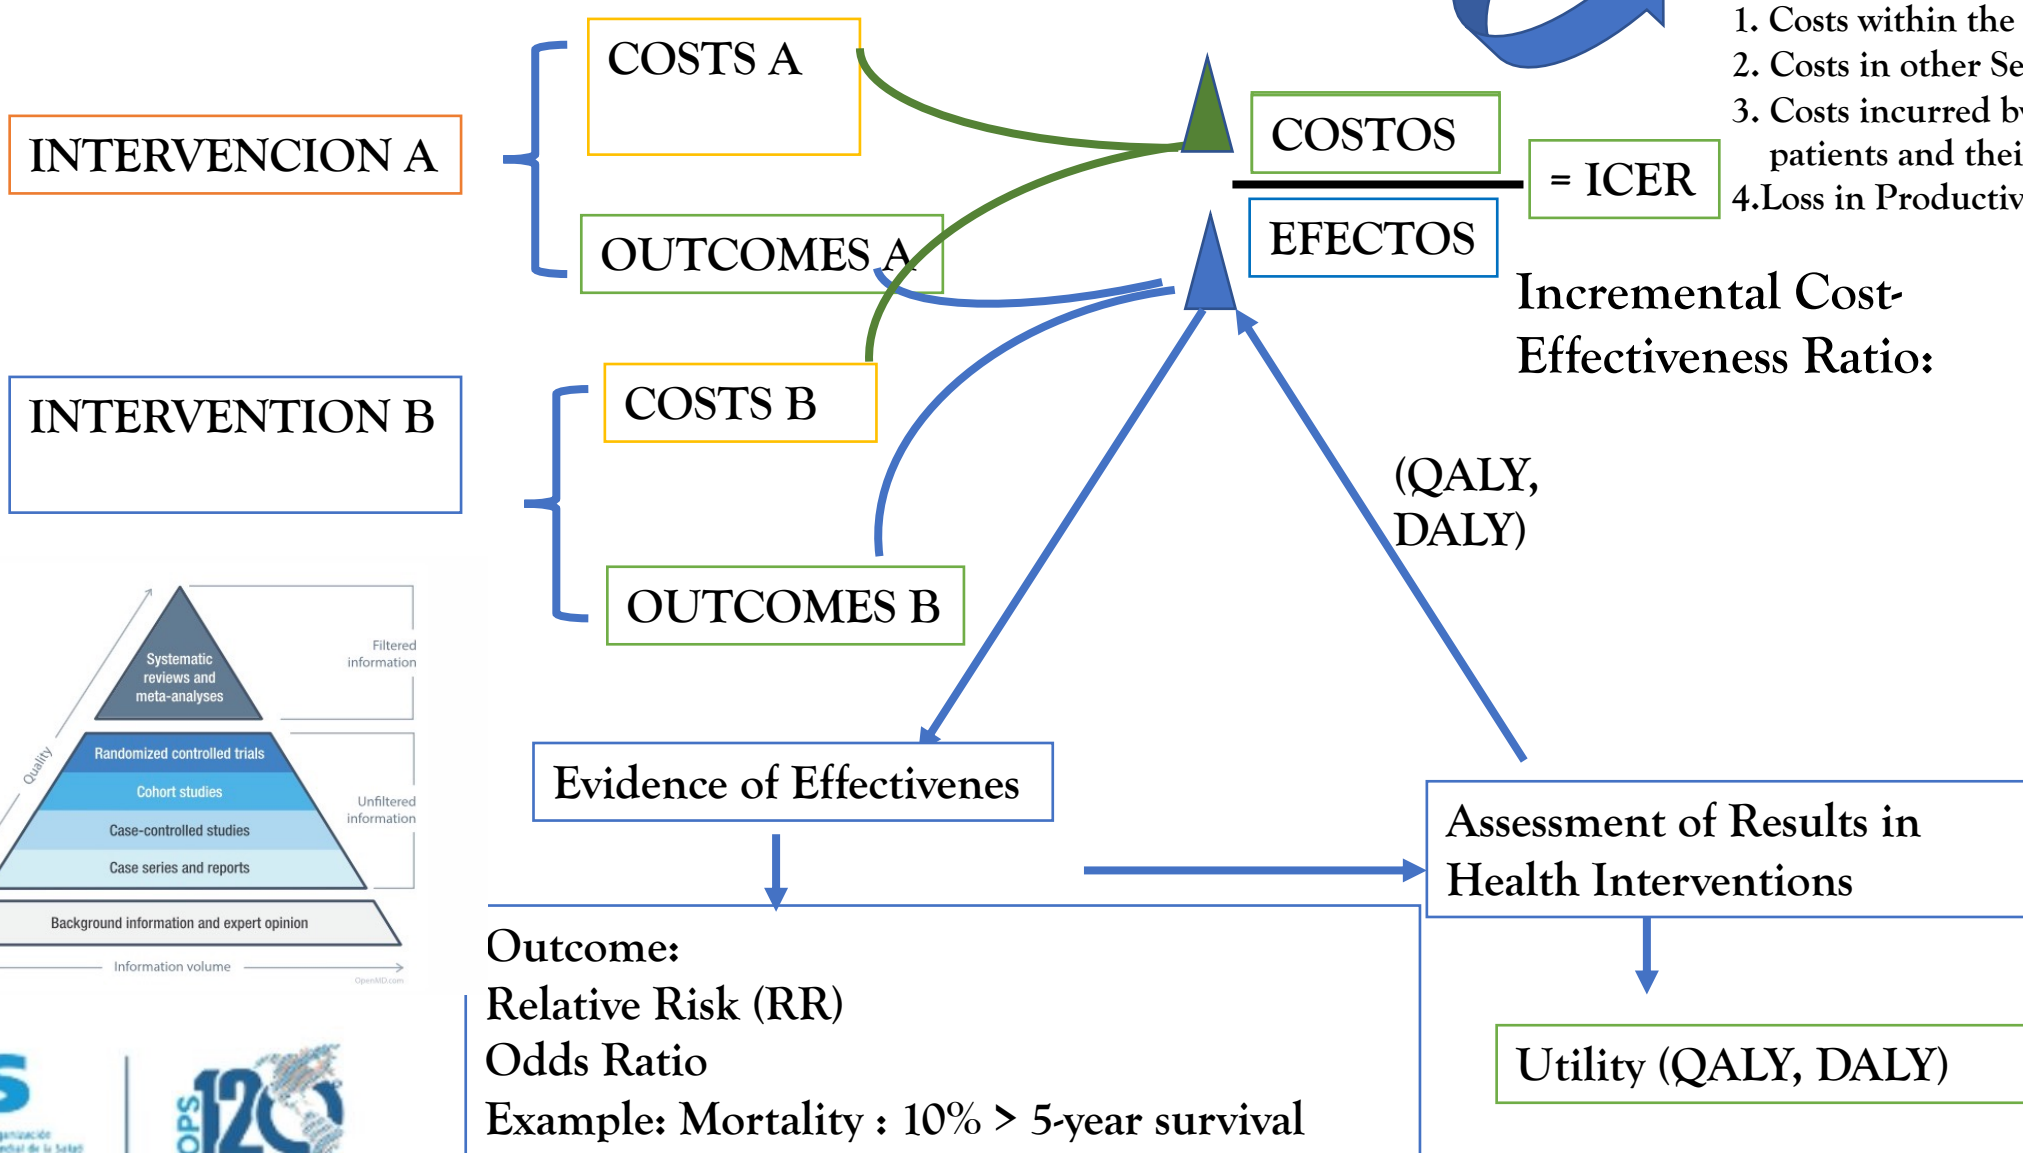

4. Elements that are analyzed when evaluating the Cost-Effectiveness of a program or intervention?

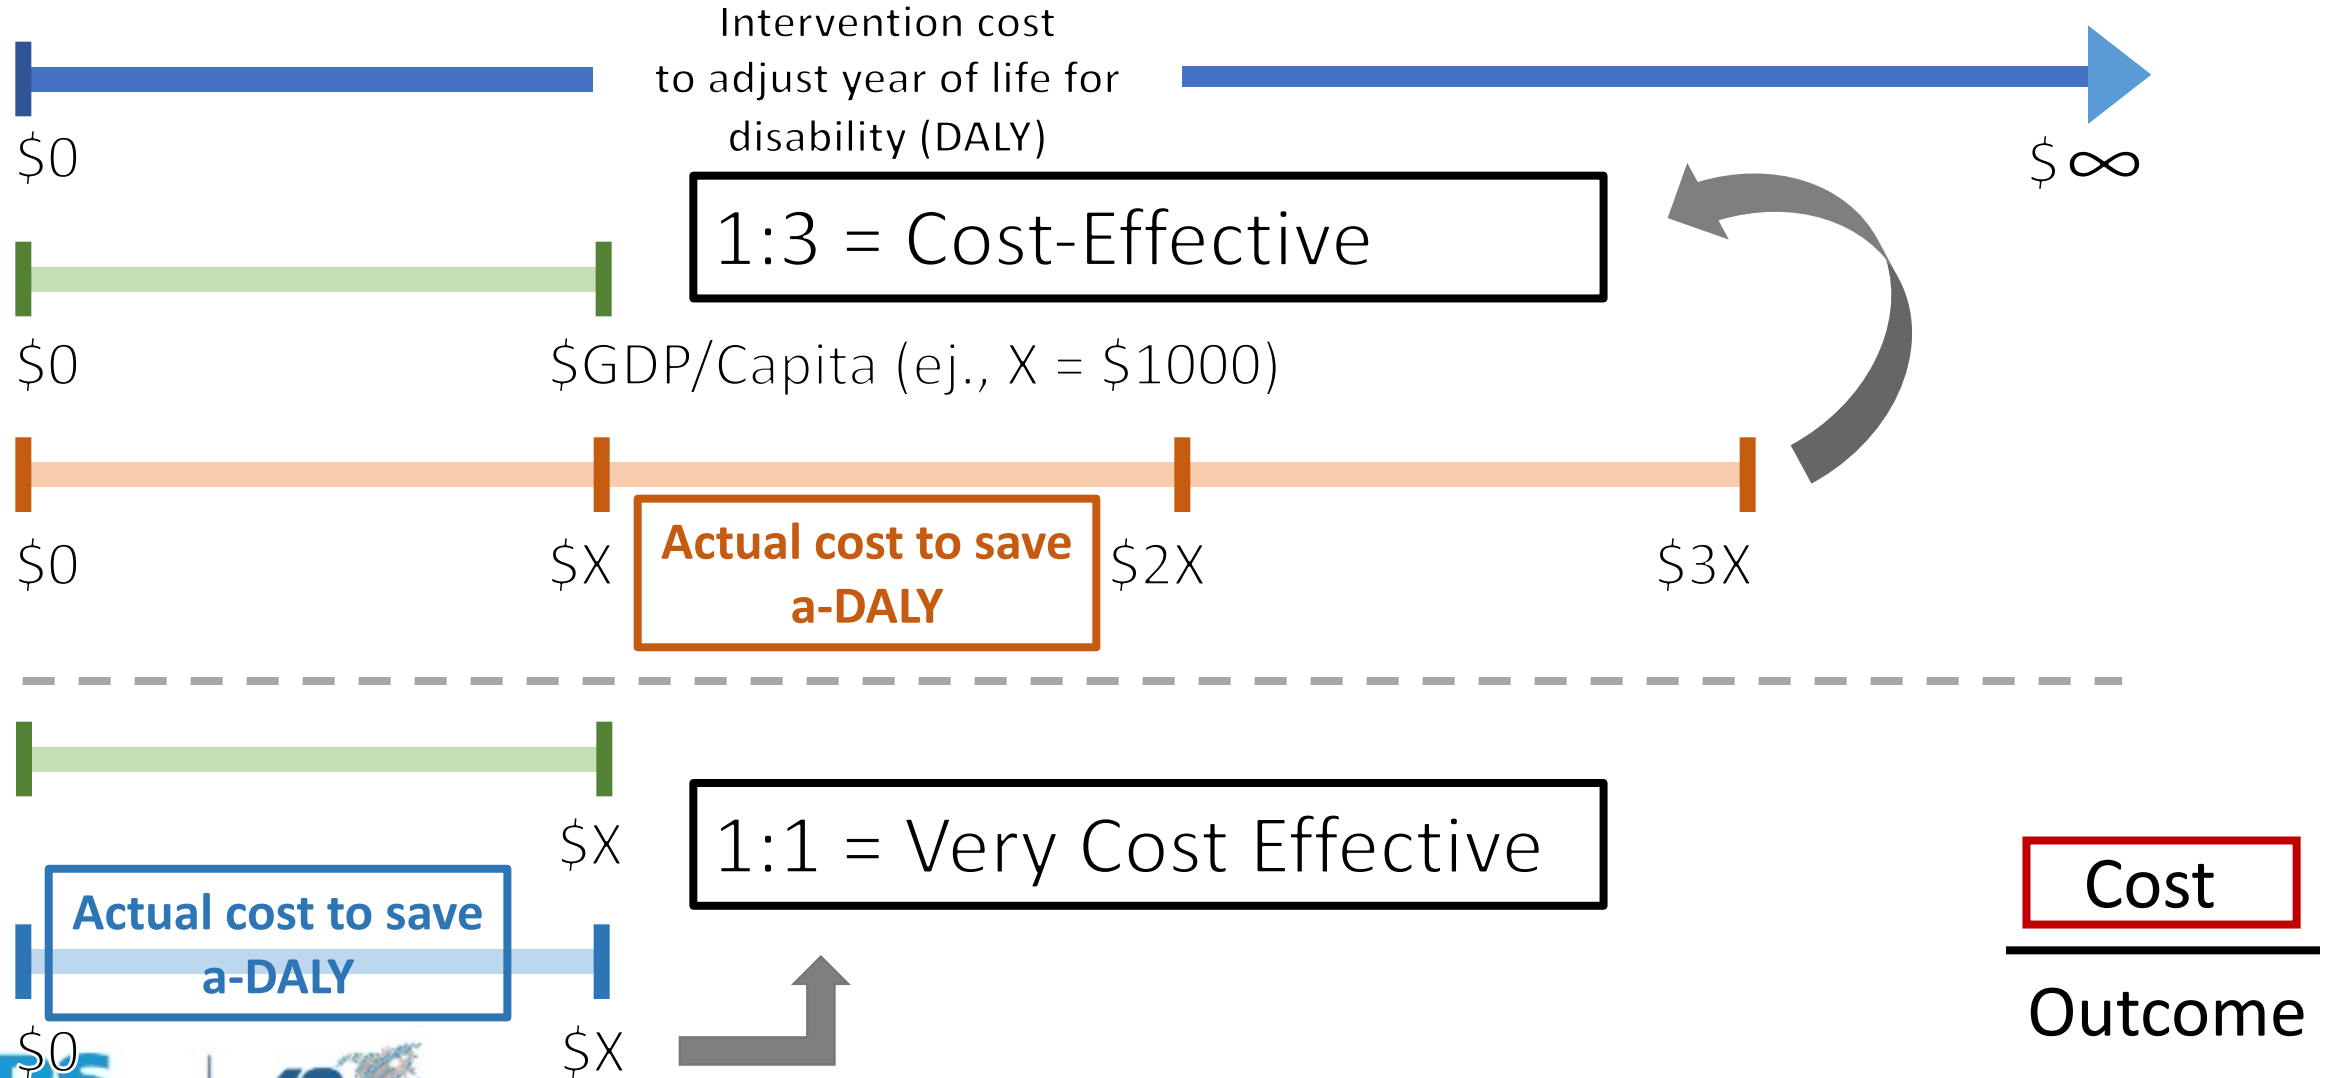

4. Elements that are analyzed when evaluating the Cost-Effectiveness of a program or intervention?

- Cost Category:
1. Costs within the Health Sector
 2. Costs in other Sectors
 3. Costs incurred by the patients and their families.
 4. Loss in Productivity..

5. What makes something Cost-Effective?

5. What makes something Cost-Effective?

- Cost-effectiveness threshold recommendations for low- and middle-income countries (WHO 2001)
- - ✓ ICER < 1 GDP per capita: very cost-effective intervention.
 - ✓ 1 GDP per capita < ICER < 3 GDP per capita: cost-effective intervention.
 - ✓ 3 GDP per capita < ICER: non-cost-effective intervention.

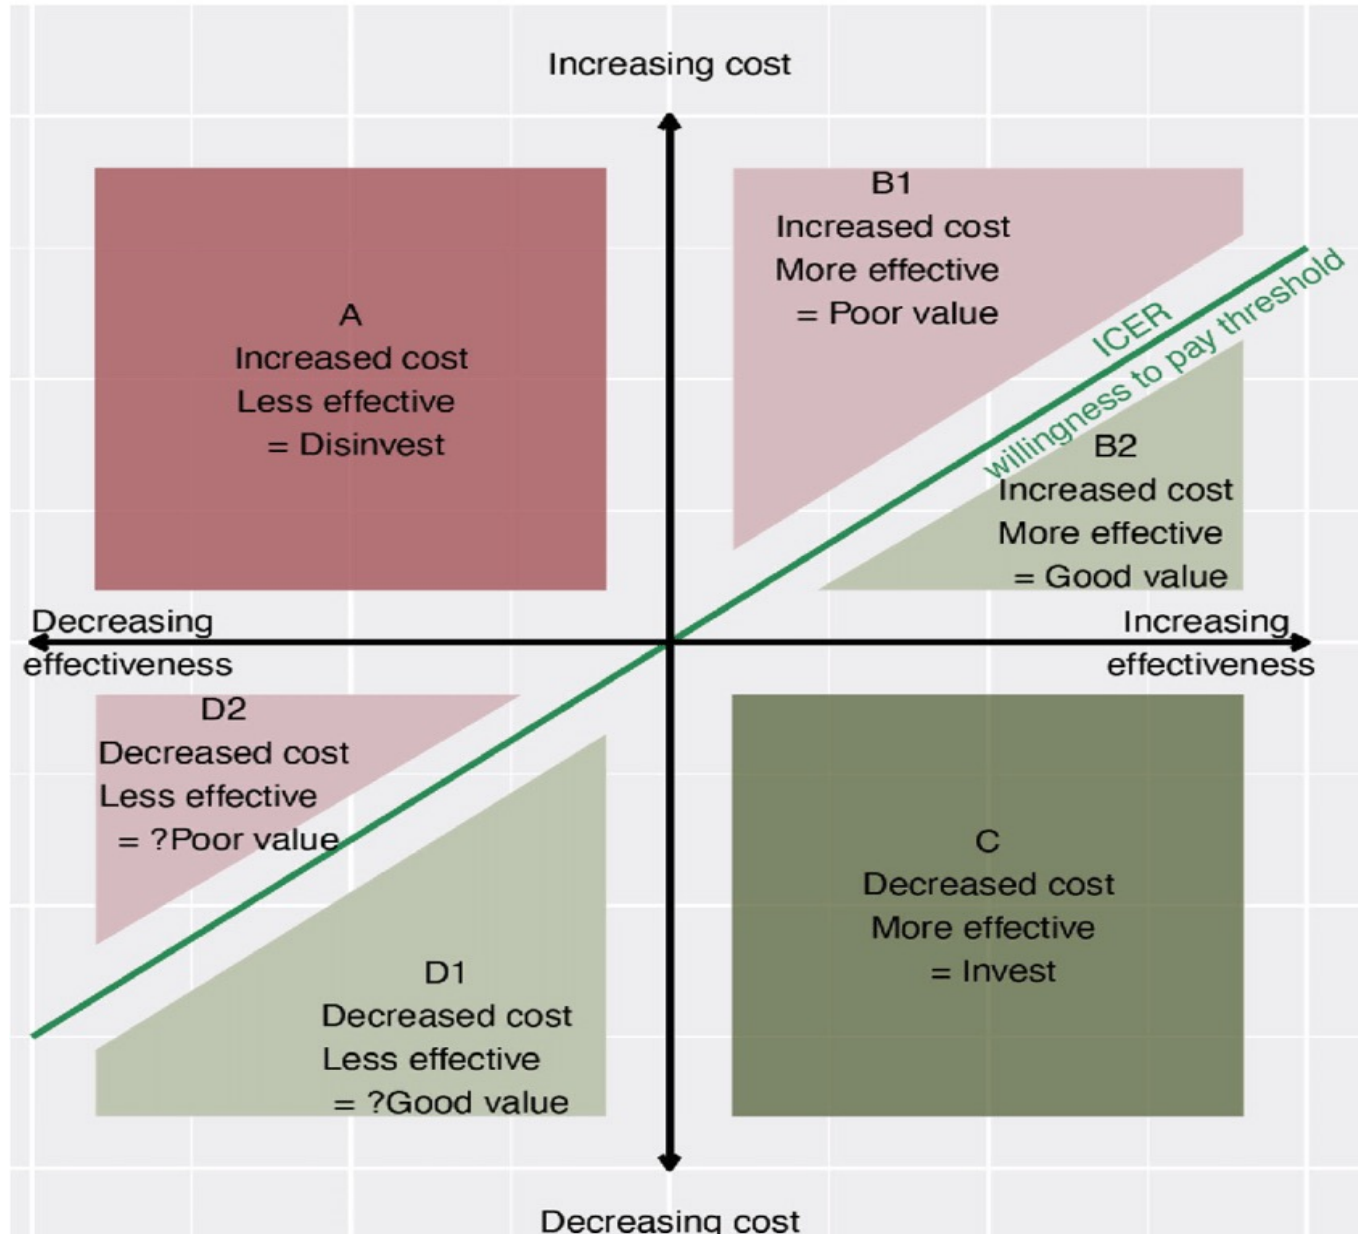

This recommendation is widely used in Latin American countries.

5. What makes something Cost-Effective?

6. Case Study: "Cost-Effectiveness of Childhood Cancer Treatment in El Salvador, Central America: A Report of the Childhood Cancer Task Force 2030."

The Cost and Cost-Effectiveness of Childhood Cancer Treatment in El Salvador, Central America: A Report From the Childhood Cancer 2030 Network

Soad Fuentes-Alabi, MD, MPH¹; Nickhill Bhakta, MD, MPH²; Roberto Franklin Vasquez, MD¹; Sumit Gupta, MD, PhD, FRCPC ^{3,4}; and Susan E. Horton, BA, MA, PhD⁵

BACKGROUND: Although previous studies have examined the cost of treating individual childhood cancers in low-income and middle-income countries, to the authors' knowledge none has examined the overall cost and cost-effectiveness of operating a childhood cancer treatment center. Herein, the authors examined the cost and sources of financing of a pediatric cancer unit in Hospital Nacional de Niños Benjamin Bloom in El Salvador, and make estimates of cost-effectiveness. **METHODS:** Administrative data regarding costs and volumes of inputs were obtained for 2016 for the pediatric cancer unit. Similar cost and volume data were obtained for shared medical services provided centrally (eg, blood bank). Costs of central nonmedical support services (eg, utilities) were obtained from hospital data and attributed by inpatient share. Administrative data also were used for sources of financing. Cost-effectiveness was estimated based on the number of new patients diagnosed annually and survival rates. **RESULTS:** The pediatric cancer unit cost \$5.2 million to operate in 2016 (treating 90 outpatients per day and experiencing 1385 inpatient stays per year). Approximately three-quarters of the cost (74.7%) was attributed to 4 items: personnel (21.6%), pathological diagnosis (11.5%), pharmacy (chemotherapy, supportive care medications, and nutrition; 31.8%), and blood products (9.8%). Funding sources included government (52.5%), charitable foundations (44.2%), and a social security contribution scheme (3.4%). Based on 181 new patients per year and a 5-year survival rate of 48.5%, the cost per disability-adjusted life-year averted was \$1624, which is under the threshold considered to be very cost effective. **CONCLUSIONS:** Treating childhood cancer in a specialized unit in low-income and middle-income countries can be done cost-effectively. Strong support from charitable foundations aids with affordability. *Cancer* 2018;124:391-7. © 2017 American Cancer Society.

KEYWORDS: cancer, cost-effectiveness, economic evaluation, oncologic services, pediatric hospitals.

Background- Centro Medico Ayúdame a Vivir (FAV) / National Children's Hospital Benjamín Bloom (HNNBB). El Salvador, C.A.

- The child population of El Salvador under the age of 15 is 2,060,193 (1).

- El Salvador The total population of life expectancy at birth is 73 (2)

The GDP per capita of El Salvador of \$4219 in 2015 (2)

- HNNBB is the only tertiary referral hospital for children.

- It has 300 beds with 1,350 employees and 300,000 patient visits annually.

- The Department of Pediatric Oncology (DPO) is one of the 30 departmental subspecialties.

- El DPO receives an average of 181 per year.

- The department treats children up to 14 years of age, with an average age at diagnosis of six years.

- (1) Digestyc ES-2007Census -2014 Projection
- (2) Basic Internal Product World Bank Data 2015
- (3)

Background- Centro Medico Ayúdame a Vivir (FAV) / National Children's Hospital Benjamín Bloom (HNNBB). El Salvador, C.A.

- The DPO has 24 inpatient beds and includes an outpatient clinic that receives more than 30,000 patient visits annually.

-
- The pediatric oncology program is mainly funded by the Ministry of Health through National Children's Hospital Benjamin Bloom and Foundation 'Ayudame a Vivir' non-profit entity. Other national and international partners or collaborators include: ASAPAC (Association of Parents of Children with Cancer), ISSS (Social Security Institute of El Salvador) and mainly the St. Jude Children's Research Hospital in Memphis, Tennessee, USA.

Justification for a Cost-Effectiveness Analysis of the National Program of Childhood Cancer El Salvador

- Previous studies have examined the cost of treating individual childhood cancers in low- and middle-income countries. However, none have looked at the overall cost and cost-effectiveness of operating a childhood cancer treatment center.
- Therefore, the cost and funding sources of a pediatric cancer unit at the Benjamin Bloom National Children's Hospital in El Salvador and Centro Medico Ayudame a Vivir were examined and cost-effectiveness estimates were made.

Methodology:

- Since the budget has financial backing from different sources, we use a ratio of (65:20) for medical/non-medical costs.
- For inpatient "hospitalization" costs, we used the WHO-CHOICE11 value for El Salvador for 2008, updated to 2016 using the U.S. Consumer Price Index.
- For Intensive Care Unit (ICU) beds we multiply this value by 3.5, the cost-per-day ratio for the ICU compared to the regular hospital bed in the El Salvador government fee structure.
- The number of inpatients and outpatients per year, the number of new cases of childhood cancer per year, and the estimated survival rates were taken from the Morbi-Mortality Information System (SIMMOW) and Medical Support System (SAM).
- Five-year survival rates were obtained from the Registry, using new case data for 2012-16.
- We compared treatment costs in 2016 with five-year survival data up to 2016, using a prevalence rather than incidence estimate.

Data Collection Sheet:

| SOURCE OF FUNDING OF CHILDHOOD CANCER TREATMENT IN EL SALVADOR | | | | | | | |

TABLE 2. Annual Costs of Operating a Pediatric Oncology Department by Major Cost Category

| Input | Quantity | Annual Cost, US\$ | Percentage of Total Cost |
|---|------------------|-------------------|--------------------------|
| Personnel | | | |
| Medical ^a | 65 FTE | 840.6 | |
| Nonmedical ^b | 20 FTE | 280.6 | |
| Subtotal: personnel | | 1121.2 | 21.6 |
| Hoteling | | | |
| General ward ^c | 3.63/d (average) | 61.9 | |
| ICU | 0.92/d (average) | 57.3 | |
| Local housing and per diem for families | 5 families/d | 116.9 | |
| Subtotal: hoteling | | 236.1 | 4.5 |
| Subtotal: outpatient clinic ^d | | 135.1 | 2.6 |
| Subtotal: other services (training, laboratory information) | | 69.4 | 1.3 |
| Shared hospital medical services | | | |
| Pathology | | 600.0 | |
| Pharmacy | | 1654.8 | |
| Radiation | | 51.9 | |
| Imaging | | 71.2 | |
| Surgery (operating room) | | 130.0 | |
| Blood services | | 510.6 | |
| Subtotal: shared hospital medical services | | 3018.5 | 58.1 |
| Subtotal: utilities ^e | | 78.3 | 1.5 |
| Subtotal: central administration cost ^e | | 537.6 | 10.3 |
| Total | | 5195.8 | 100.0 |

Abbreviations: FTE, full-time equivalent; ICU, intensive care unit.

^aIncludes oncologists (4 FTE), pediatricians (3 FTE), radiation oncologists (4 FTE), pharmacists (4 FTE), nurses (40 FTE), a general surgeon (1 FTE), an orthopedic surgeon (1 FTE), neurosurgeons (4 FTE), pathologists (2 FTE), laboratory technicians (2 FTE), and a pain specialist (1 FTE).

^bIncludes a departmental registrar (1 FTE), a cancer registrar (1 FTE), oncological psychiatrists (2 FTE), social workers (2 FTE), an ambulance driver (1 FTE), secretarial support (3 FTE), managers (3 FTE), warehouse personnel (2 FTE), an accountant (1 FTE), and data entry personnel (3 FTE).

^cIncludes cost of cleaning, maintenance, laundry, food for patients, etc. Costs of cooks (3 FTE), maintenance personnel (7 FTE), and security personnel (2 FTE) are incorporated here.

^dIncludes space cost for outpatient clinic; treatment costs for outpatients are included under various treatment headings.

^eIncludes the unit's share of central utilities and purchasing and contracting administration costs, weighted by cancer unit share of Hospital Nacional de Niños Benjamin Bloom total inpatient stays (11.2%).

Results

Graph III - Relative frequencies by ICCC. El Salvador (2012-2016) - Average per Year n=181
ROPESAL 2017

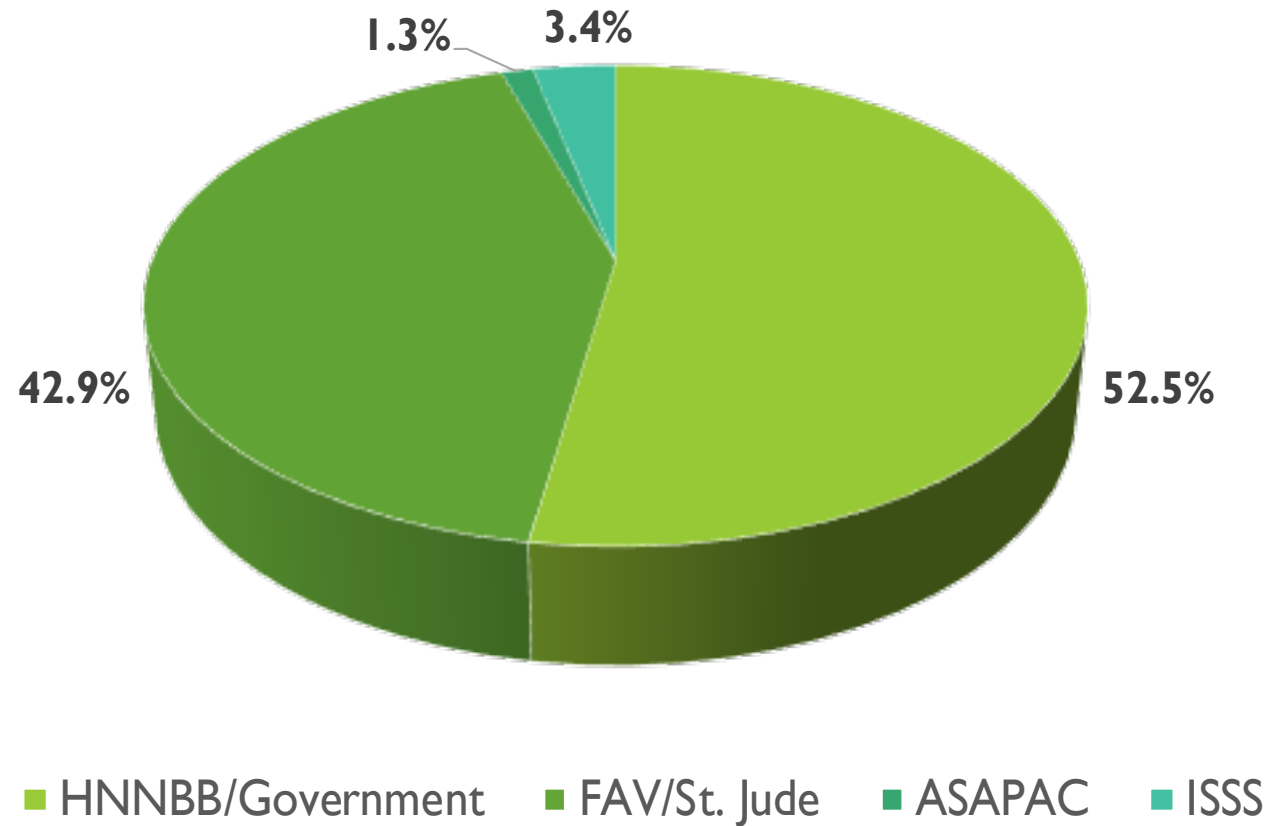

The five-year overall survival for the entire cohort was 48.5% +/- 5.6%.

Of the entire cohort, only one patient abandoned therapy.
