

# The new WHO air quality and health database for the Americas

Unit of Climate Change and  
Environmental Determinants of Health (CE)

# Health impact of air pollution in the Americas

**35%**  
of deaths from  
**lung disease**

**15%**  
of deaths from  
**stroke**

**44%**  
of deaths from  
**heart disease**

**6%**  
of deaths from  
**lung cancer**

**Deaths attributable to air pollution in the Americas (2016)**

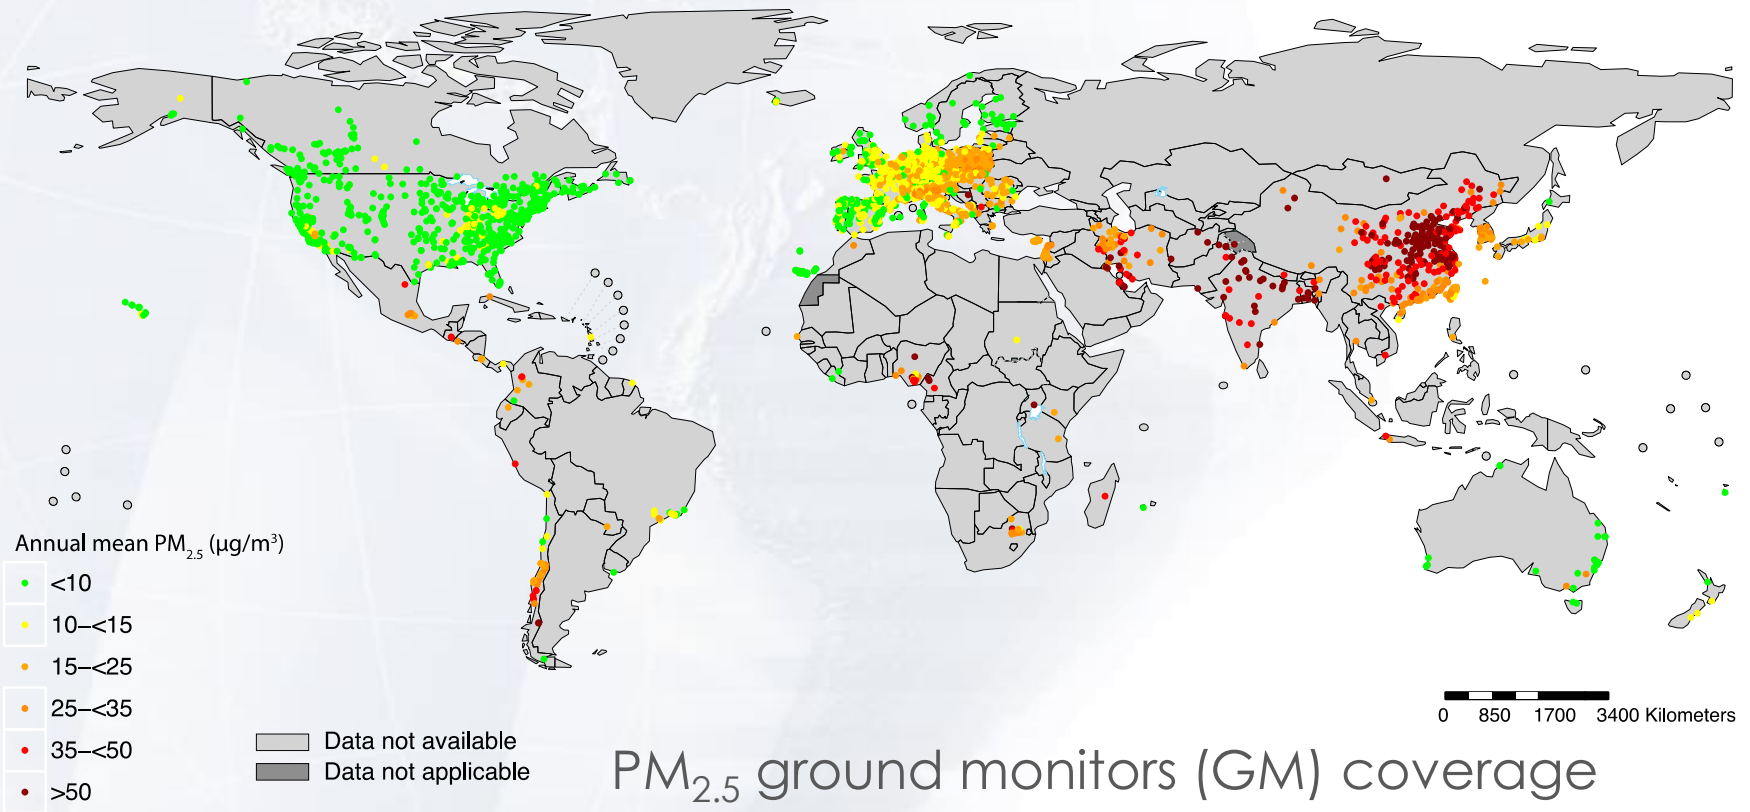

Every year around  
**7 MILLION DEATHS**  
globally are due to  
exposure to air  
pollution

# Ambient air quality database

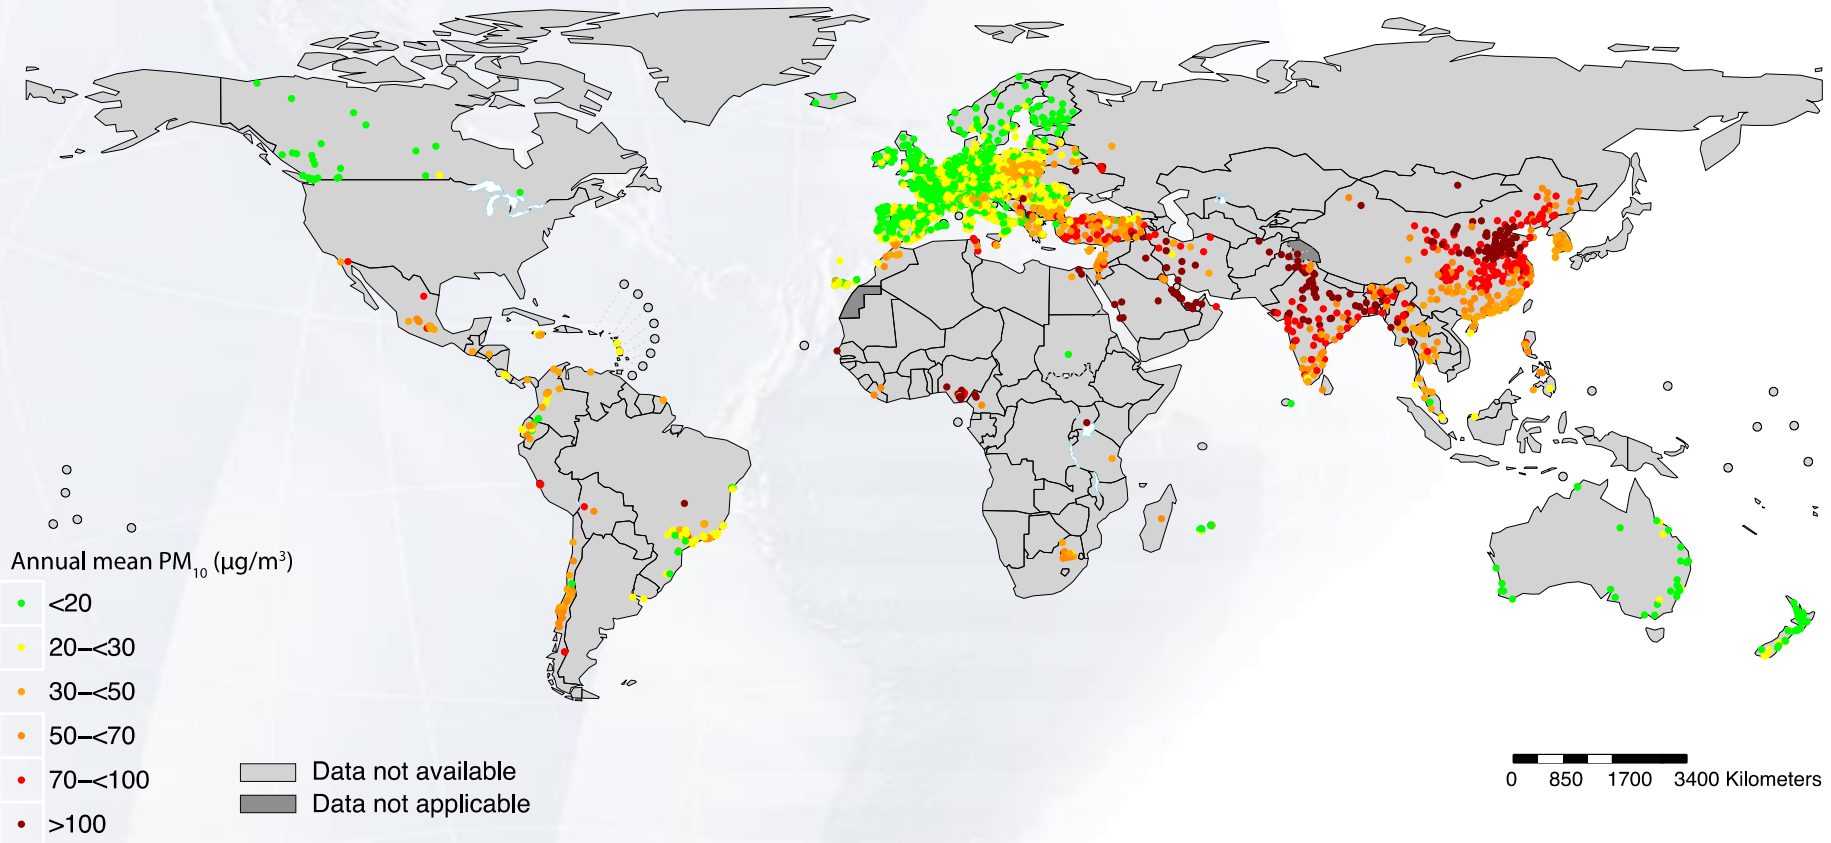

Database coverage for the Americas:

- Number of countries: 20
- Number of cities: 927

# Ambient air quality database

## PM<sub>10</sub> ground monitors (GM) coverage

# PM<sub>2.5</sub> modelled estimates

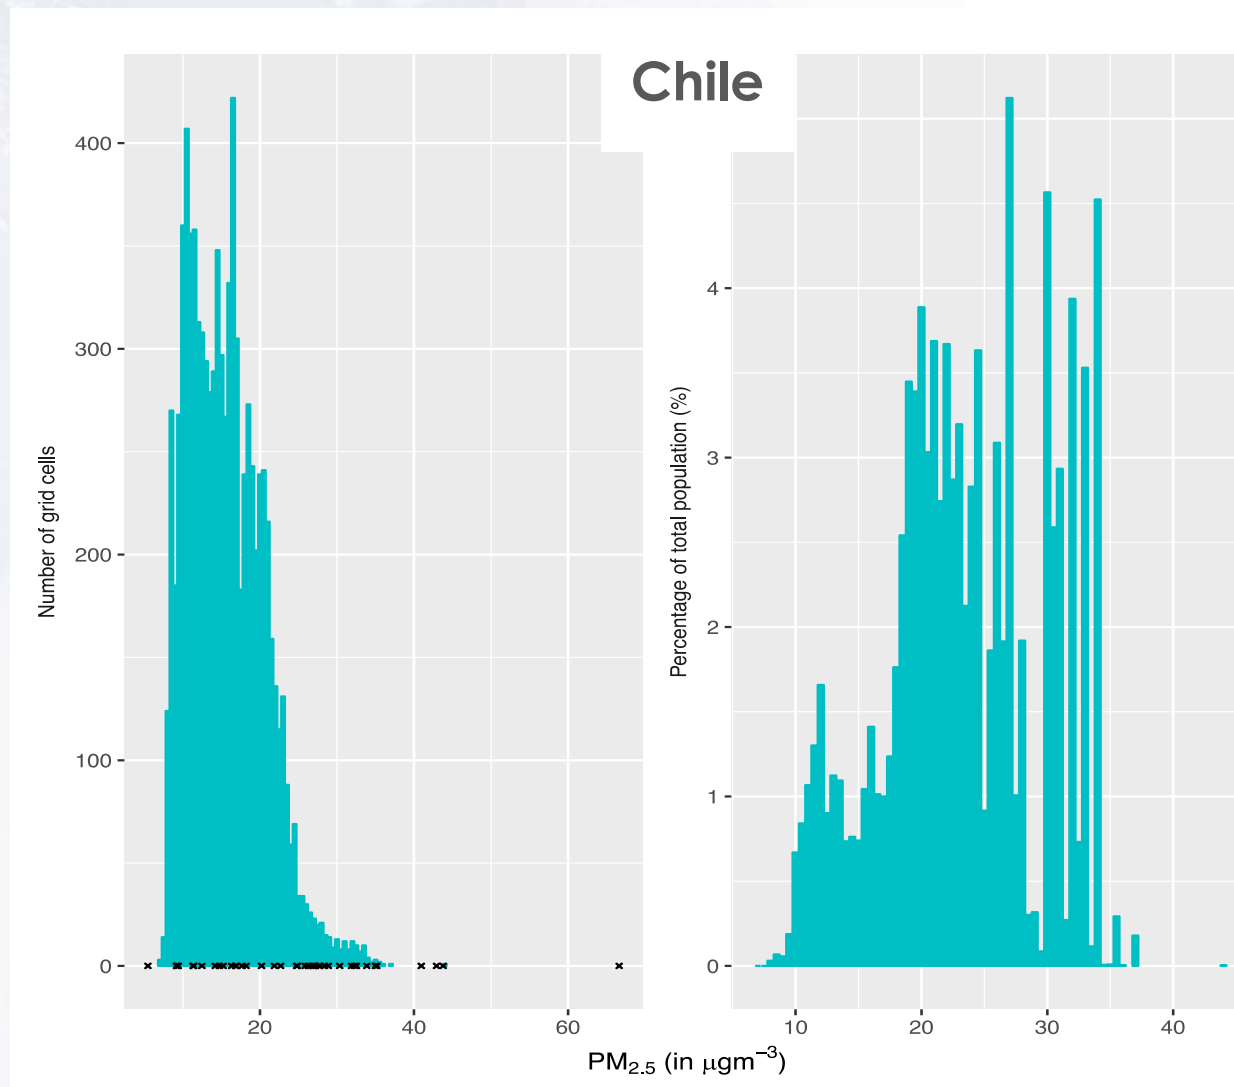

## Why:

- To cover areas that are not covered by GM measurements.
- To allow the calculation of the exposure, based on population and PM<sub>2.5</sub> concentration.

## How:

- Using the Data Integration Model for Air Quality
  - Satellite remote sensing (Aerosol optical depth) compared with data from more than 9.000 GMs
  - Population
  - Resolution: 0.1° × 0.1° globally (about 10 km × 10 km)

# PM<sub>2.5</sub> modelled estimates: an example

# Median modelled PM<sub>2.5</sub> concentration (µg/m<sup>3</sup>) (2016)

# Usage of clean and polluting fuels (%) (2016)

# Age standardized mortality (per 100'000) (2016)

## PAHO air quality program

Reduce the adverse health effects of air pollution in the Americas

### *Mainstreaming health in air quality management*

Expanding the knowledge base

Monitoring and reporting

Leadership and coordination

Institutional capacity strengthening

Legislation

Planning

Risk analysis

Household energy

Road transport

Health care providers

Governance

# Thank you!
