

THE PATH TOWARD ENDING AIDS BY 2030

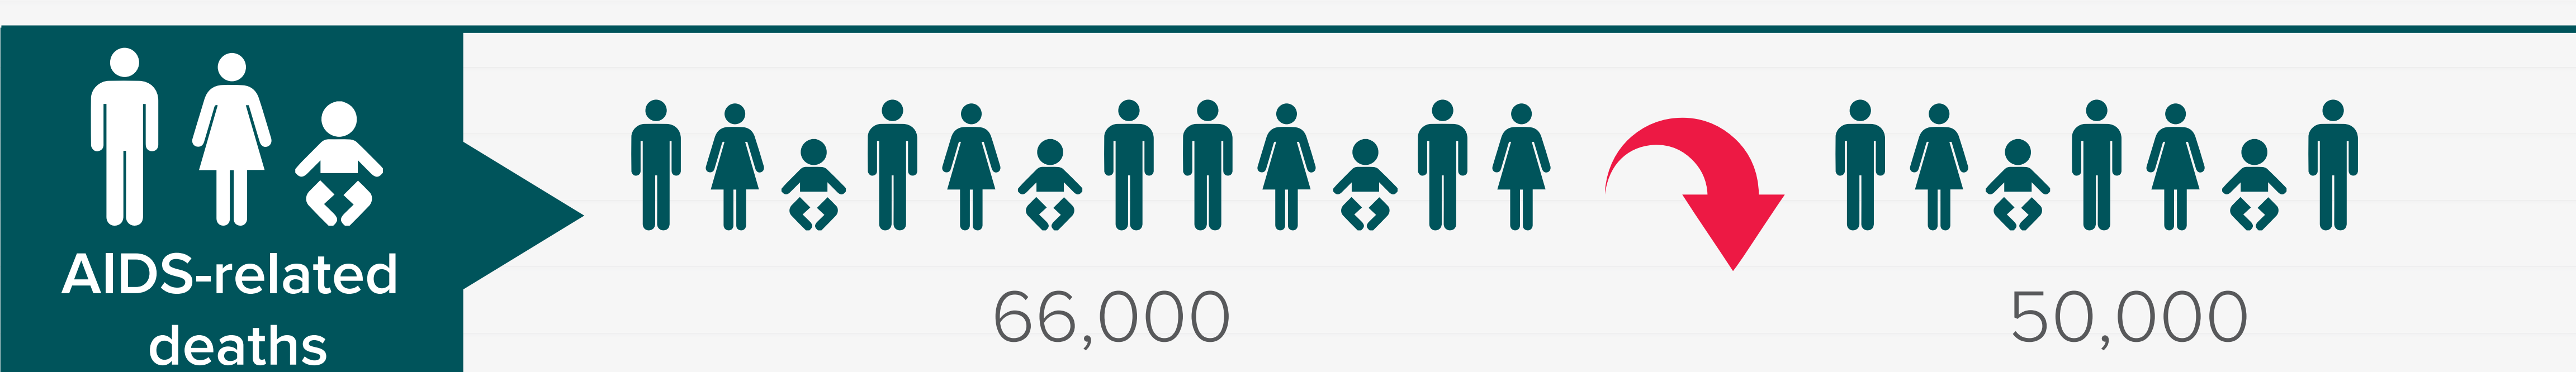

Over the past 15 years, a great deal of progress has been made in controlling HIV. But we're only half-way there. Combined efforts toward prevention, early detection, and expanded treatment will be crucial to halt transmission of the virus in the coming years.

NEW INFECTIONS IN LATIN AMERICA AND THE CARIBBEAN (LAC)

New infections **have declined** significantly among children but have remained flat among men.

CARE AND TREATMENT FOR PEOPLE WITH HIV IN 2015

Total number of people living with HIV in LAC: **1.9 MILLION**

75% have been diagnosed
Goal for 2030: At least 95% of people living with HIV know that they have it.

55% of people living with HIV are receiving antiretroviral treatment
Goal for 2030: At least 95% of people diagnosed with HIV have access to antiretroviral therapy to live healthy lives and prevent infection in others.

41% of people living with HIV have undetectable levels of HIV in their blood
Goal for 2030: At least 95% of people on antiretroviral treatment have undetectable levels of HIV in their blood.
