

Global & Regional Update. 2 PM WDC.

17 April 2020

Global 2,119,283
cases

146,818
deaths

212
countries/territories/areas

HIGHLIGHTS

In the Region of the Americas, the Island of Bonaire which is one of the three (3) islands together known as (BES Islands) – Bonaire, Sint Eustatius and Saba – and part of the Dutch Caribbean – reported their first confirmed COVID-19 case in a local resident. To date, Sint Eustatius and Saba have reported two (2) cases each for a total of five (5) cases of COVID-19 on the BES islands.

- An additional 40,662 cases and 2,612 deaths were reported in the past 24 hours – representing an 5% (cases) and 7% (deaths) relative increase compared to the previous day. Majority of the new cases (32,549 cases, 85%) and deaths (2,163 deaths, 85%) continue to be reported from the United States of America.
- In the United States, while the deaths in New York State are declining slightly (630 new deaths), neighboring New Jersey reported a doubling of deaths in one week – from 1,933 total deaths last week to 3,840 this week.
- The U.S. CDC published a [Morbidity and Mortality Weekly Report \(MMWR\)](#) which reported that 19% of the 315,531 COVID-19 cases reported in the country between 12 February – 9 April were among Health Care Personnel (HCP). Among those with data available, the median age was 42 years ([IQR] = 32–54 years), 6,603 (73%) were female, and 1,779 (38%) reported at least one underlying health condition.
- Other countries in the region with significant increase in cases compared to the previous day are Brazil (2,105 additional cases, 7% increase), Canada (1,775 additional cases, 7% increase) and Peru (2,014 additional cases, 18 % increase).
- While the true mortality of COVID-19 will take some time to fully understand, the data we have so far indicate that the crude mortality ratio (the number of reported deaths divided by the reported cases) for the region is approximately 5%, mostly driven by cases and deaths from the US. The crude mortality ratio among the countries/territories with more than 1,000 cumulative cases reported to date are Mexico (7.7%), Ecuador (13%), Brazil (6.3%) and the Dominican Republic (4.8%). See table 1. Of note is Ecuador rate which has steadily increased from 8.1% last week to 13% this week.

China: The death toll in Wuhan city was revised in the past 24 hours adding 1,290 deaths and raising Wuhan's total from 2,579 to 3,869, a 50% increase and China's national total from 3,342 deaths to 4,632, a 38.6% increase. China also reported an additional 325 cases in Wuhan. The underreporting was attributed to the large surge of cases early in the outbreak hindering data collection efforts, testing hurdles, deaths outside hospitals and healthcare facilities not being able to utilize the central reporting system.

26 new cases were reported in China of which 15 are imported and 11 are local cases (5 cases in Guangdong, 3 cases in Heilongjiang, 2 cases in Shandong, 1 case in Liaoning); no new deaths

Today, WHO issued a warning against using serological tests to determine whether a person has immunity or is no longer at risk of becoming re-infected. Currently, it is still unknown if a person with antibodies is fully protected against the disease or being re-infected – and if so, for how long that protection lasts. This is important because many countries are considering using the levels of antibody as thresholds/passports for relaxing the current social distancing rules in place.

*Recovered counts as indicated by reporting Member States

†Data reported by state/district/territory public health authorities. Confirmed case and death totals may include a small proportion of probable cases and deaths due to differences in reporting. Excludes counts for Guam, Commonwealth of the Northern Marianas, Puerto Rico, and the United States Virgin Islands

‡To date, the probable deaths are those reported and defined by New York City, available at <https://on.nyc.gov/2RloJdU>

§Probable deaths as defined by the Ecuador Ministry of Public Health, available at: <https://bit.ly/2RZtqJR>

¶Total confirmed cases reported as per Peru Ministry of Health, of which 7,703 cases tested positive by RT-PCR and the remaining 5,786 cases tested positive by rapid diagnostic tests (RDTs); however, to date, these RDTs are not recommended for use by WHO

Note: WHO recommends using the following categories to describe **transmission patterns** at national and sub-national levels (wherever possible) to guide decisions for preparedness, readiness and response activities.

Category number	Category name	Definition
1	No cases	Countries/territories/areas with no cases
2	Sporadic cases	Countries/territories/areas with one or more cases, imported or locally detected
3	Clusters of cases	Countries/territories/areas experiencing cases, clustered in time, geographic location and/or by common exposures
4	Community transmission	Countries/area/territories experiencing larger outbreaks of local transmission defined through an assessment of factors including, but not limited to: - Large numbers of cases not linkable to transmission chains - Large numbers of cases from sentinel lab surveillance - Multiple unrelated clusters in several areas of the country/territory/area
