

Large scale genomic surveillance of SARS-CoV-2 in the UK: challenges and lessons learned

Dr Cristina Ariani
Genomic Surveillance Operations Lead

28th of September 2021

Wellcome Sanger Institute

A world leader in genome research that delivers insights into human and pathogen biology that change science and medicine

Our Covid operations so far...

COVID-19 surveillance (as of 20 September 2021)

690,348

coronavirus genomes sequenced by the Sanger Institute

1,024,987

coronavirus genomes sequenced by the COVID-19 Genomics UK (COG-UK) consortium

300+

Sanger staff have contributed to the 7-days-per-week operation

Believe it or not, 18 months ago, this is how we started

Completely new challenge!

We were figuring out how to work as a large team to best effect

First stand up meeting on the 17th of March 2020
Tanya Brooklyn chairing

Volunteers

Limited number of people on campus

“The teams, they didn’t have to come on site. You volunteered to come on site and everyone put their hands up. It was great!”

Project Heron

High throughput genomic monitoring of the SARS-CoV-2 virus in the UK, aiding public health officials in their response to the coronavirus pandemic.

Monitor the virus for genetic mutations which could have public health implications

Process Overview

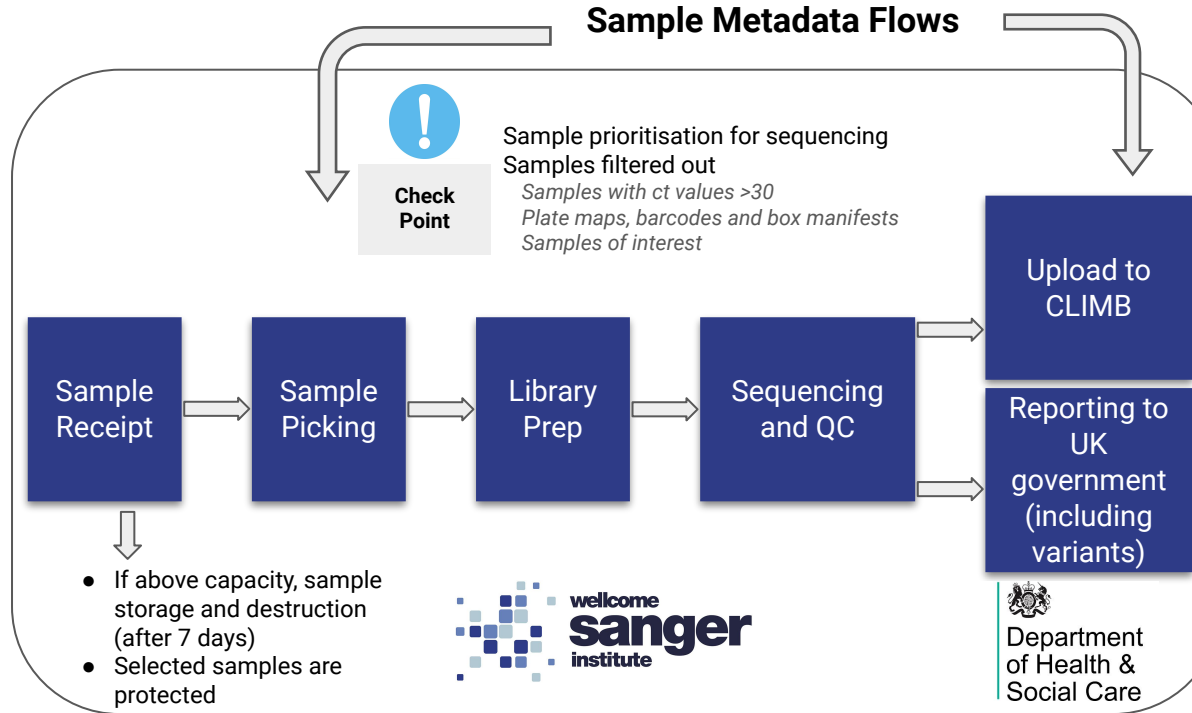

Operational Data Flows

- Box manifest (which plates in which boxes)
- Plate Maps (which sample in which well)

Sample Flow

- Daily deliveries from all labs
- 7 day/week
- Boxes of 96 well plates of DNA/RNA extracts
- Barcoded boxes and plates

Samples storage

Five temporary refrigerated containers at the car park
Each container holds 273 boxes
Each box holds 80 96-deep-well plates (~2 million samples in each container)

New labs dedicated to Covid

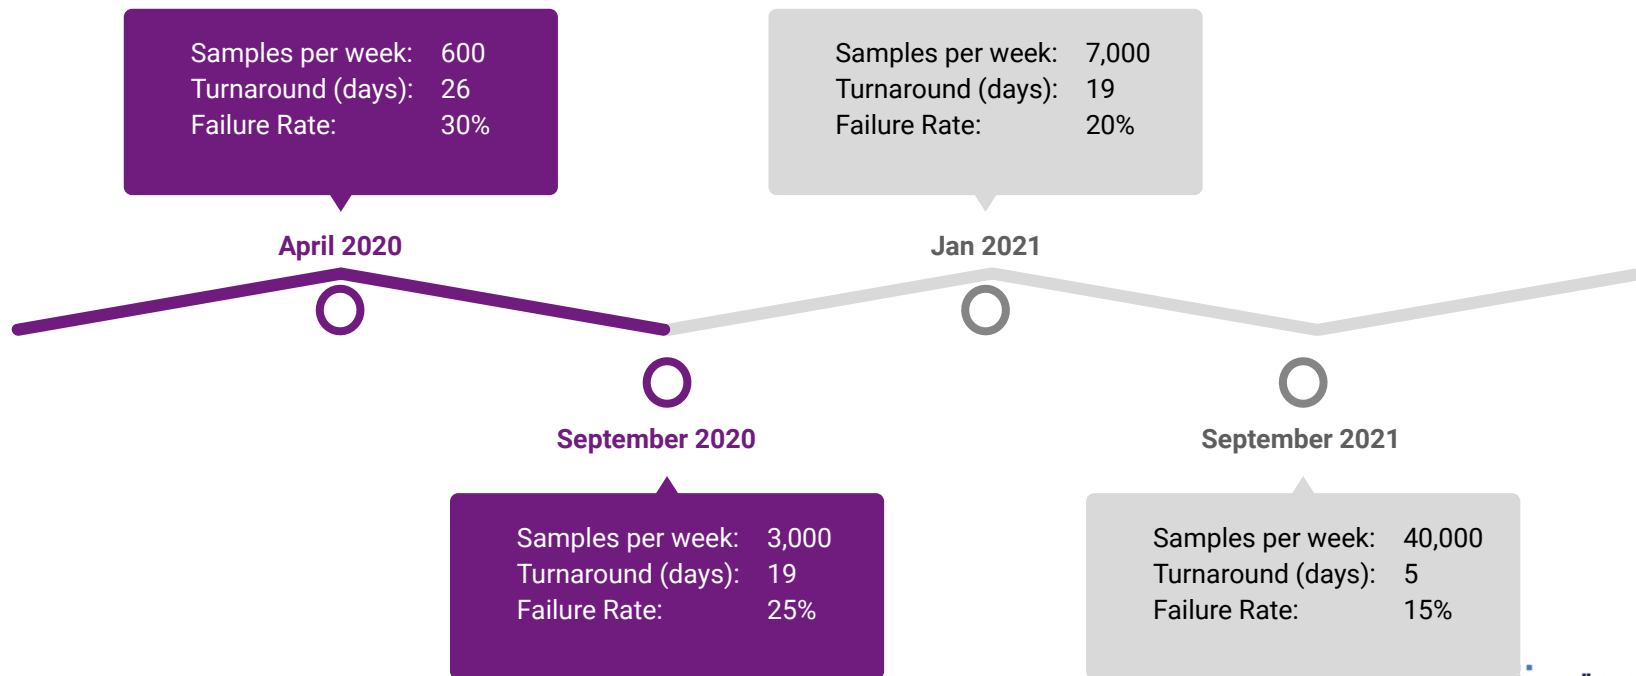

Robotics: 4 Beckmans and 2 Bioseros
Redundancy and resilience - global shortages

7 Illumina Novaseq - 10k samples
per machine.
Average 2.5M reads per sample

The Journey

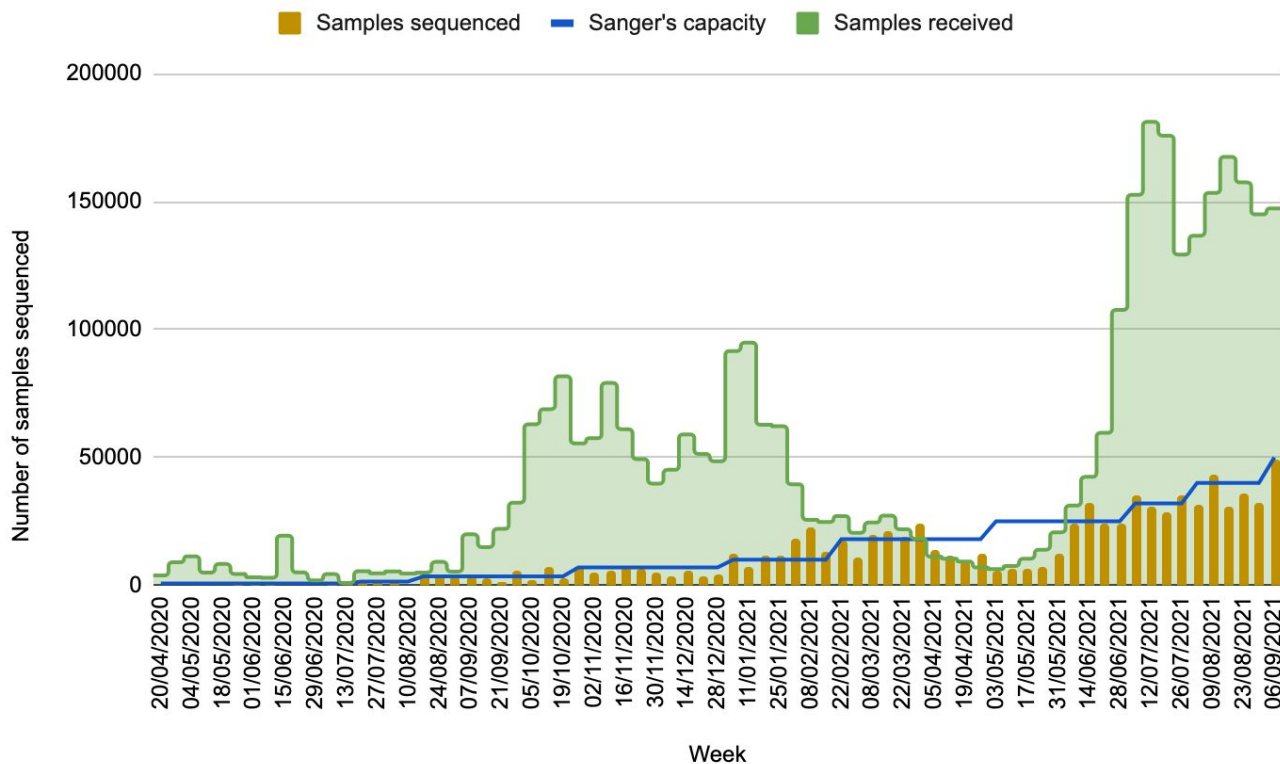

Samples sequenced per week

Samples sequenced per week

Samples received and sequenced per week

Samples received and sequenced per week

Journey of Improvement

Weekly average performance

- QC
- Sequencing
- Pre-sequencing
- Test to arrival at Sanger

Challenges

- Global shortage of supplies
- Constantly changing landscape
- Logistics - getting samples and metadata to Sanger
- Sheer volume of samples handled
- Large team work
- External dependencies
- Timeliness of outcome
- Managing expectations - everyone wants their samples sequenced!
- Sample prioritisation - outbreaks, Eagle project and samples of interest
- Internal reporting - build a new system to track samples
- External reporting to Department of Health and Social Care - manual then fully automated
- Staff self-isolating, limited number of staff on site
- Floods, fires, sweat and tears, but also laughter

Lessons Learned

- Develop a really good relationship across all parts of the end-to-end process including external organisation
- Do not focus on targets but seek improvement and perfection
- Work really hard at creating a single view of the process through performance data
- Expect bumps in the road, bend and flow with them and seek improvement over a long period of time
- Continually invest in the science and robotics and support functions (IT, Facilities, HR)
- Recruit lab leaders that are used to high throughput labs
- Develop more capacity than you need, to cope with issues and problems
- The data QC part of the process to ensure high quality of data.
- Difficulties were with the constantly changing landscape and external dependencies as it was hard to pick apart what changes were having impact as often another part of the process would also be in flux.

More to do...

Improve, improve, improve

Increase capacity

And more!
